	Urgent	Not Urgent
Important	**Do — Your MVP** • Allow users to manually add, edit, and delete football matches and busy periods. • Detect overlaps between matches and the user's class or study schedule, as well as between matches. • Display upcoming matches in chronological order and indicate which ones have no scheduling conflicts. • Save matches and busy periods to a file and load them when the program starts.	**Schedule — For V2.0+** • Automatically import match schedules from a football API. • Let users assign priorities to matches and suggest which match to watch when games overlap. • Add reminders before selected matches begin.
Not Important	**Delegate — Use a Library** • Use Java's `java.time` classes to parse, validate, and compare dates and times. • Use Java's built-in sorting methods to order matches by kickoff time. • Use Java's file I/O classes to read and write schedule files.	**Delete — Cut It** • Live match commentary and real-time score updates. • A social feed where users post and discuss matches. • An AI system that predicts match results.
